Dipylon (www.dipylon.org) is a non-profit organization for the study of ancient topography. It was established in Athens in 2014 to promote interdisciplinary research in Archaeology, History, Informatics and Cartography. The organization's main goal is to collect, organize, and share archaeological knowledge by making the most of state-of-the-art technology in digital humanities.

The aim is to support academic research and education on the historical topography of ancient cities and cultural landscapes. To achieve this, the team develops open-access cartographic platforms and web apps (including audio walks tours), conducts educational activities, and participates in national and European funding programs.
